WAITING ON A ANSWER

What is a fossil.

Fossils are the preserved remains of plants and animals whose bodies were buried in sediments, such as sand and mud, under ancient seas, lakes and rivers. Fossils also include any preserved trace of life that is typically more than 10 000 years old.

Ammonites

Ammonites are a common type of fossil they look a bit like a snail but are actually a form of shellfish from the dinosaurs time.

Belemnites

Crystals

The crystals are generally formed when some type of liquid starts cooling down and ultimately creates a solid structure. This is the process of how crystals form in rocks. They mainly develop when liquid rocks like magma start to cool down

You are allowed to have a look
at these fossils as long as you
are careful.

Time for a prayer

Dear God,
Help us to appreciate
the beauty around us,
of things old and new,
loved and in need of
looking after. Help us
do our best and learn
to be curious.
Amen.

Take a moment to reflect on
this picture.

The background is a light cream color with intricate, swirling floral patterns in shades of blue and yellow. A large, detailed blue butterfly is positioned on the right side of the image. The names 'Minnie' and 'Ernie' are written in a stylized font, and the phrase 'Thank you!' is written in a large, elegant script at the bottom.

Minnie

Ernie

Thank you!
